

EA BOT: SYSTEM LOGIC & WORKFLOW

Candidate: Eduardo Gonzalez

1. My Approach: Logic & Reliability

I approached this assignment from an **Operations and Audit perspective**. Instead of writing complex code from scratch, my goal was to design a workflow that eliminates human error. I focused on defining the specific rules and data integrity checks the system must follow to be reliable, ensuring the process is scalable and audit-ready.

2. Fetching Data (Data Integrity)

Data accuracy is the priority here. I don't trust the system to "guess" who the client is based on the email body.

- **The Strategy:** I set the workflow to extract the **Email Domain** (e.g., @company . com) directly from the calendar invite metadata.
- **Why:** The system uses that domain as a unique identifier to query HubSpot. If the domain matches the CRM record, we create a fail-safe: we know 100% that we are customizing the agenda for the correct company.

3. Building the Agenda (Standardization)

I wanted personalization, but without the risk of an AI hallucinating sales pitches.

- **The Solution:** I built a structured **"Logic Table"** in Google Sheets to act as the brain of the operation.
- It works like a strict decision tree: **IF** the client Industry is "Logistics," **THEN** the system pulls the sector-specific value proposition from the database . This ensures the messaging remains on-brand, controlled, and relevant to the sector, removing variability.

4. Parsing the Transcript (Accountability)

This is where my background in compliance comes in. My main concern is ensuring nothing gets lost after a meeting.

- **The Process:** I configured the AI prompt with a strict filter: *"Extract only Action Items, Owners, and Due Dates."*
- **The Result:** The system converts unstructured conversation into structured data (Task + Date + Person). This ensures every commitment made in the meeting is logged in HubSpot. It removes ambiguity and enforces accountability.

5. Training the Tone (Quality Control)

To achieve the "CEO voice," I treated the AI like a new employee: it learns better by example than by instruction.

- **Method:** I utilized a "Comparison Database" showing **Draft vs. CEO Approved** examples.
- Instead of hard-coding complex grammar rules, the system compares the new draft against the approved examples to understand that brevity and directness are the standard. It acts as a quality control mechanism before the email is generated.
